GENIEMAT[®] FFNP

Simple Installation Guide for Under Screed Applications

GENIEMAT® FFNP

Simple Installation Guide for Under Screed Applications

PREPARATION

- i. Make sure substrate is cured and clear of debris.
- ii. Install **GenieMat®** perimeter isolation strip to the base of the wall.

- iii. Unroll and place **GenieMat FFNP** underlayment on the concrete substrate, then turn over to let it relax.
- iv. Trim ends and sides of each roll to fit floor surface area. White chalk is useful for marking the underlayment before cutting. Always use a sharp knife and place scrap cardboard under the **GenieMat FFNP** when cutting to avoid blunting the blade on the substrate.

- v. Align the lengthwise edges of the underlayment with neighbouring sheets by butt jointing them up or overlapping (as per details below).

Overlap Joint Detail

Butt Joint Detail

-
- vi. Use duct tape or high-quality carpet tape to secure butt joints and seams, and prevent underlayment from moving.
 - vii. Make sure there are no gaps at seams or at perimeter junction between perimeter isolation strip and **GenieMat® FFNP**. Off-cuts can be cut and used to fill gaps.
 - viii. **GenieMat FFNP** is now ready for the chosen screed to be installed (ensure desired screed height is lower than the height of the **GenieMat** perimeter strip)
 - ix. Trim **GenieMat** perimeter strip to be level with the top of the cured screed.
